

Andrei Silviu Dragnea

Senior Rust Backend Engineer / Contractor / Freelancer

ABOUT ME

I am a Senior Rust Backend Engineer / Contractor / Freelancer with **11+ years of experience**, only interested in remote work.

Contributor to **Solana** with bug fixes, including a **memory leak fix**.

Contributor to **Anchor framework** with bug fixes.

Contributor to **Go Ethereum** with bug fixes to debug methods.

Contributor to **Docker** with documentation improvements.

Ex-Adobe engineer in **Identity Management System** and **Video Analytics** teams.

Do you need software solutions for your business? Drop me a message!

MOST RELEVANT WORK EXPERIENCE

Senior Rust Solana Engineer | Baton Corporation

Pump AMM

June 2024 - October 2025

The client, Baton Corporation, contributor to Pump protocol on Solana chain, wanted to migrate the completed bonding curves of coins launched on Pump memecoin platform from Raydium AMM to their own Pump AMM.

- Designed, implemented, tested and deployed Pump AMM program, the AMM with the biggest daily volume on Solana network (**\$8 billion 24h volume**), using the Anchor framework. The AMM is based off Raydium CPMM, but the protocol and liquidity provider fees are always collected in the quote token.
- Created the public Typescript **pump-swap-sdk**, which allows our frontend, mobile and 3rd parties to easily integrate with Pump AMM program.

Skills: Rust, Solana, Anchor, Typescript, AMM, CPMM, Helius, Jito, Bloxroute, Grafana, NextJS, NestJS, NPM, Heroku, Supabase, BetterStack, Raydium, Orca, ChatGPT, Claude, GitHub Copilot

Senior Rust Solana Engineer | Baton Corporation

Coin Creator Fee System

June 2024 - October 2025

The client, Baton Corporation, wanted to give a part of the protocol fees collected on coin swaps to the coin creator in order to incentivise more creators to create more coins on Pump memecoin platform.

- Increased the daily number of coin creations **2.6x times, from 5K to 13K** by updating both Pump and Pump AMM programs to allow the coin creator to collect a part of protocol fees on each coin swap.
- Created the public Typescript **pump-sdk**, which allows our frontend, mobile and 3rd parties to easily integrate with the latest Pump program updates.

Skills: Rust, Solana, Anchor, Typescript, Grafana, NPM, Jest, ChatGPT, Claude, GitHub Copilot

Senior Rust Solana Engineer | Baton Corporation

Solana Transaction land rate improvements

June 2024 - October 2025

The client, Baton Corporation, wanted to increase platform fees revenue and improve user experience by optimizing the Solana transaction land rates.

- Reduced Solana transaction failure rates **from 10% to 5%** by listening to the latest Solana accounts state using websockets and fixing logical errors in both program SDKs.
- Extracted the common React components and transaction submission logic and in a **pump-solana** Typescript SDK to re-use it across the React website and React Native mobile app.

Skills: Rust, Solana, Anchor, React, React Native, Typescript, Helius, Jito, Temporal, Grafana, NPM, Supabase, ChatGPT, Claude, GitHub Copilot

EDUCATION

Faculty of Automatic Control and Computers,
Politehnica University of Bucharest
Bachelor in Computer Science
2013-2017

- Senior Rust Solana Engineer |  Baton Corporation

Customizable fee structure

June 2024 - October 2025

The client, Baton Corporation, wanted a more flexible fee basis points for protocol, creators and liquidity providers based on the coin market capitalization, to incentivise new coin creators.

 - Increased coin creator revenue by **2x times** by implementing a Pump Fee program, which dynamically computes the fee bps tier based on the current coin market capitalization through a Solana CPI call on each swap.

Skills: Rust, Solana, Anchor, Typescript, NPM, Jest, ChatGPT, Claude, GitHub Copilot
- Senior Rust Solana Engineer |  Baton Corporation

Optimizing coin creation Solana costs

June 2024 - October 2025

The client, Baton Corporation, wanted to incentivise users to create more coins on the platform by reducing the Solana on-chain coin creation costs.

 - Reduced Solana on-chain creation costs **by 75%** by using Token2022 Program Metadata and create_mint instruction instead of Token Program combined with Metaplex Metadata.

Skills: Rust, Solana, Anchor, Typescript, Token Program, Token2022 Program, Metaplex
- Senior Rust Software Engineer |  NeonLabs

Rust Solana Geyser Plugin

May 2023 - June 2024

The client, NeonLabs, main contributor to NeonEVM blockchain development, needed a database containing historical Solana data including account states for supporting Ethereum debug methods in NeonEVM.

 - Wrote a custom Solana Geyser Plugin which sends events related to account updates to a Kafka (Redpanda) cluster and handles **2.5K TPS** without falling behind the network. A ClickHouse database cluster is populated with the data from Redpanda.

Skills: Rust, Solana, Redpanda, ClickHouse, Prometheus, Serde, Protobuf, Axum, Hyper, Tokio, jsonrpsee, rdkafka
- Senior Rust Software Engineer |  NeonLabs

Rust JSON-RPC Server

May 2023 - June 2024

The client, NeonLabs, main contributor to NeonEVM blockchain development, needed to improve performance of a JSON-RPC server sharing its implementation logic with the NeonEVM Solana program.

 - Improved RPS by 40x from 5 to 200**, by leveraging the maybe-async crate and migrating the RPC server from Axum to Actix, which supports non-Send Futures.

Skills: Rust, Solana, Axum, Actix, maybe-async, Tokio, Future, Procedural macros, JSON-RPC, Anchor
- Senior Rust Software Engineer |  NeonLabs

Rust Ethereum JSON-RPC Server

May 2023 - June 2024

The client, NeonLabs, main contributor to NeonEVM blockchain development, wanted NeonEVM to support the same RPC debug methods as the ones offered by the Ethereum.

 - Improved developer experience by 75%** by allowing the same debugging tools as on the Ethereum chain, by implementing struct/opcode logger, prestateTracer and callTracer in NeonEVM JSON-RPC service.

Skills: Rust, Solana, Go Ethereum, jsonrpc-v2, ClickHouse, Actix, Tokio

- Senior Rust Software Engineer |  NeonLabs

Solana History Recovery Service

May 2023 - June 2024

The client, NeonLabs, main contributor to NeonEVM blockchain development, wanted a way to replay any Solana transaction from any point in blockchain history for fixing truncated logs or debugging NeonEVM transactions.

 - **Improved Solana history recovery speed by 6x, from 4 hours to 40 minutes**, by automating and parallelizing the downloading and unpacking of Solana accounts snapshots and ledger archives. A simple Geyser plugin is hooked into agave-ledger-tool to intercept Solana transaction metadata.

Skills: Rust, Solana, Geyser plugin, Google Cloud Big Table, Google Cloud Storage
- Senior Rust Software Engineer |  Adobe

Rust web application

May 2021 - May 2023

The client, Adobe Video Analytics, part of the Adobe Experience Cloud, had significant infrastructure costs on the video events collection system because of it being a JVM application.

 - **Reduced CPU usage by 2.6x and memory usage by 51x** by rewriting the API server from Scala to Rust.

Skills: Rust, Axum, Actix Web, Warp, Scala, Serde, Tokio, Futures, Prost, Moka, Cargo, RdKafka, Async, Kubernetes, Helm, Kapitan
- Senior Scala Software Engineer |  Adobe

Traffic filtering

May 2021 - May 2023

The client, Adobe Video Analytics, part of the Adobe Experience Cloud, had significant infrastructure costs because of traffic generated by one important customer which did not pay a subscription.

 - **Reduced infrastructure costs by 35% (\$1.4M per year)** by implementing a traffic filtering mechanism in the video event collection system. The ID of every video session has an embedded boolean flag which indicates if the events of that session are dropped or not.

Skills: Scala, Akka, Kafka, Spark, cats-effect, Caffeine, Circe, Maven, Protobuf, sbt, Kubernetes, Maven, Docker, Helm, Kapitan, Jenkins
- Senior Scala Software Engineer |  Adobe

Service migration from Java 8 to Java 17

May 2021 - May 2023

The client, Adobe Video Analytics, had a legacy application that needed new features and developers could not be productive using an old Java version.

 - **Updated legacy application from Java 8 to Java 17**, by first bringing all the dependencies of the application to the latest versions, then bumping the Java version.

Skills: Java, JDK, Mockito, Spring, Spring Boot, JUnit, TestNG, Apache Tomcat, Docker
- Senior Scala Software Engineer |  Adobe

System resilience improvement

May 2021 - May 2023

The client, Adobe Video Analytics, part of the Adobe Experience Cloud, had an application with unpredictable performance on traffic spikes or when an upstream service became unavailable.

 - **Improved service resilience by 12x** by correctly handling blocking code in the context of a non-blocking application, thus reducing on-call incident rates.

Improved service fault-tolerance by 15x by isolating the blocking writes to each of our upstreams to its own blocking thread, thus limiting the impact of a faulty upstream to only a fraction of customer traffic.

Skills: Scala, Java, Kafka, cats-effect, ExecutorService, CompletableFuture, Concurrency

- **Senior Scala Software Engineer |  Adobe**
Automatic dependency updates May 2021 - May 2023

The client, Adobe Experience Cloud, needed periodic updates to the dependencies of all code repositories of the organization, both for security reasons and new features.

 - **Reduced operational costs related to dependency updates by 95%** by installing a bot which automatically applies and validates dependency version updates.
 - **Contributed to the Renovate open-source project** with bug fixes for dependency updates in our application.

Skills: GitHub, Renovate, Jenkins, Docker, Earthly
- **Senior Scala Software Engineer |  Adobe**
Build time optimization May 2021 - May 2023

The client, Adobe Video Analytics, part of the Adobe Experience Cloud, had an application with very slow compile times, which reduced developer productivity significantly.

 - **Reduced project compilation time by 3x, from 3 min to less than 1 min** by optimizing JSON codec generation at compile time and migrating the Scala project build system from Maven to sbt.

Skills: Scala, Circe, IntelliJ IDEA, Maven, sbt
- **Senior Scala Software Engineer |  Adobe**
Jenkins Job DSL May 2021 - May 2023

The client, Adobe Experience Cloud, needed a way to automatically bootstrap a new CI server from a version-controlled specification.

 - **Reduced Jenkins Pipeline jobs creation time by 95%** by using Jenkins Job DSL. I also added static analysis, test results and coverage reports for both successful and failing CI builds, in order to improve developer productivity.

Skills: Jenkins, Jenkins Pipeline DSL, Jenkins Job DSL, Jenkins Code Coverage API, Jenkins Warnings Next Generation Plugin
- **Senior Scala Software Engineer |  Adobe**
Duplication removal May 2021 - May 2023

The client, Adobe Video Analytics, part of the Adobe Experience Cloud, had many components in its systems which used duplicated code, increasing the risk of bugs when updating one copy and leaving another behind.

 - **Reduced code duplication by 80%** by extracting a module containing common code used by multiple components of our application, thus also reducing coupling between modules.

Skills: Scala, Refactoring, Scala Kubernetes Client, Circe, Maven, Kafka, Async Programming, cats-effect, ScalaMock, ScalaTest
- **Senior Java Software Engineer |  Adobe**
Azure Active Directory Synchronization server May 2018 - May 2021

The client, Microsoft Azure Active Directory, wanted to automate the management of identity data between Microsoft and Adobe systems.

 - **Reduced identity data import time by 99%, from a few days to 15 minutes**, by implementing a SCIM2 server for pushing user and group creation and update events from Microsoft Azure AD to Adobe Identity System.

Skills: Java, Kotlin, Kotlin coroutines, Spring, Spring Boot, Project Reactor, Netty, Redis, Mockito, JUnit, TestNG, SCIM2, Refactoring, Maven, Gradle, Docker, Jenkins, Azure Active Directory, Azure Graph API, Jakarta EE

- **Senior Java Software Engineer |  Adobe**
Re-use the same business logic for both a blocking and non-blocking application May 2018 - May 2021
The client, Adobe Identity Management System, wanted to reduce infrastructure costs by scaling only the traffic-heavy components of a monolithic application under heavy load.
 - Reduced infrastructure costs **by 70%** by extracting a core business logic component used both in the legacy monolithic blocking application and in a new non-blocking microservice. The decoupled component was re-written from Java to Kotlin using coroutines.**Skills:** Java, Kotlin, Kotlin coroutines, Refactoring, IntelliJ, Gradle, Maven, Spring, Spring Boot, MySQL, Cassandra, WildFly, Java EE
- **Senior Java Software Engineer |  Adobe**
Simplified system design May 2018 - May 2021
The client, Adobe Identity Management System, wanted to reduce infrastructure costs by simplifying the traffic flow for the most used identity APIs.
 - Reduced traffic through internal systems **by 60% (from 100K RPM to 40K RPM)** and instance count **by 70% (from 30 to 9)** by bypassing an intermediate service. I extracted a common business logic module called both by the core service and intermediate service. Then I made the core service call the target service directly, instead of the intermediate one.**Skills:** Java, Spring, Maven, Refactoring
- **Senior Java Software Engineer |  Adobe**
Created clean tests framework May 2018 - May 2021
The client, Adobe Identity Management System, wanted to help its developers write more maintainable tests.
 - Improved developer productivity **by 50%** by creating a clean tests framework on top of Mockito, TestNG, JUnit 4, JUnit 5 and Spring TestContext framework. This framework automatically guides developers into writing decoupled tests with minimum setup.**Skills:** Java, Mockito, Spring, Spring Boot, SpringTestContext, JUnit 4, JUnit 5, TestNG
- **Senior C Software Engineer | Instacar**
Car sharing application September 2017 - December 2017
The client, a car sharing company, wanted to allow customers to control and monitor rented cars remotely through a mobile application.
 - **Reduced operational costs by 90%** by implementing a TCP server over a proprietary binary protocol for remote car control. The cars could be unlocked and have their gas level checked automatically from a monitoring dashboard.
 - **Improved application resilience by 80%** by recompiling the Linux kernel with custom TCP settings in order to compensate for a faulty TCP implementation on the devices used for remote car control.
 - **Reduced codebase size by 30%** by writing a PyCharm plugin for automatic dead code elimination. The codebase also had to be annotated with Python 3 type hints in order to guide the dead code elimination process.**Skills:** C, Linux kernel, TCP, Binary Protocols, PyCharm, IntelliJ
